

Professor Frederik Mottola

A New Exciting Way for Teens' to Experience Traffic Awareness

Providing **lifesaving** experiences **before licensing!**

Are you tired of having lackadaisical teens in the classroom who pay more attention to texting than to the lesson on hand?

How would you like to have every teen come prepared with a mind-set for successful performance during each in-car session?

Mottola has spent the past forty-five years developing space-management techniques, some that you may have been introduced to and use. During the past three years he and his staff have drawn upon extensive research on brain development to produce activities to give teens online and classroom "experiences," that are capable of providing a "mind-set" for the correct actions, repeatedly. The teen is then able to demonstrate success during in-car sessions.

Teens receive brain-training activities to guide what the hands and feet will do.

You Will Receive:

- A series of Space Management activities for teens' online use and PDFs for classroom teachers.
- A system to engage teens for expert habit development.
 - Set of Chip Cars for use with Google Earth Roadways
- Eye Check Mirror/Rear View Mirror
 - DVR Camera/Recorder
 - 2GB SD card

Bring Laptop Computer if available.

Who is this Workshop For?

Any excellent classroom or in-car teacher wanting teens to acquire space-management habits that will serve them for their entire driving career.

A fun way to get teens to become more aware of traffic situations.

- Teens will learn how to evaluate a traffic scene by using the Selective Attention Matrix (teachers will also learn about its power).
- Teens will learn where "critical seconds" are located and be prepared to take controlling actions.
- Teens will learn how to detect and correct skids by practicing "on target," "off target" during every day driving.
- Teens will enjoy the challenging game-like activities while earning points for their actions.
